Remote activation of vending machines in the online system

Remote control of vending machines

Each PCCADDIE online vending machine can be configured so that other vending machines can be activated when it is activated by the map service on the server. This function is useful for multi-level access conditions.

Here are some practical examples to illustrate this:

1. The alarm system is to be activated by authorised employees when they leave the building.
2. Access to your administration building is restricted by PC CADDIE Mifare readers from a defined time. Only authorised persons should be able to enter the area and for this it is necessary to deactivate the activated alarm system.
3. Your entrance area has an area accessible to members that is not covered by the alarm system as there are toilets there. This is immediately followed by an access area with increased security. It is possible to open the main door with your individualised Mifare card access via the remote control of vending machines, and the subsequent door for the security area can also be unlocked and the alarm system deactivated.

As this configuration is very extensive and complex and requires a corresponding hardware installation please contact our support team for installation.
